SUMMARY

Data Driven Product Builder with hands-on experience shipping an AI-powered advising product from user research through evaluation, and a track record of using data (SQL, Python, Power BI) to challenge assumptions and prioritize what matters most.

PRODUCT WORK

AI-Powered Career Advising Product

Apr 2026 – Present

- Reduced advisor manual data-entry time 10 hours per week, measured across the advising workflow, by building an AI-assisted prototype that closed a demand-visibility gap across 7 career interest areas.
- Increased recommendation grounding in real employer demand, measured against a course-catalog-only baseline, by building the engine on a 42-posting job corpus instead of catalog text alone.
- Eliminated an experience-level mismatch skewing recommendations, measured across all 42 sourced postings, by auditing and replacing 5 postings that didn't match student readiness.
- Validated recommendation quality across 3 student segments, measured by RAGAs-based evaluation metrics, resulting in a pilot roadmap with 6 recommendations adopted by the department.

EDUCATION

Master of Science, Engineering Management

Jan 2024 – Dec 2025

Missouri University of Science and Technology

- Coursework: Integrated Product and Process Design, Operations Research Management, Advanced Financial Management

Bachelor of Technology, Mechatronics Engineering

Aug 2019 – Jul 2023

ICFAI University

CORE SKILLS

- Product: Customer Discovery, Competitive Analysis, User Stories, Feature Prioritization, Roadmap Support, Go-to-Market Strategy
- Analytics: SQL, Python, Power BI, Microsoft Excel, KPI Definition, Data Modeling, Dashboard Development, Root-Cause Analysis
- Execution: Agile, Cross-Functional Collaboration, Risk Management, Requirements Documentation, Stakeholder Communication, Launch Readiness, Go-to-Market Support
- Technical: AI Workflow Design, Generative AI, Workflow Automation, Technical Tradeoff Analysis

EXPERIENCE

Student Engagement Center | Missouri S&T

Aug 2024 – Aug 2025

- Improved outreach reporting efficiency by 20%, measured against prior manual reporting time, by building automated Excel/Access workflows and defining KPIs.
- Reduced inconsistent reporting decisions across departments, measured by standardized data definitions and validation rules, by partnering with cross-department stakeholders to align reporting standards.
- Increased student event engagement by 25%, measured across outreach campaigns, by documenting reusable workflows for outreach tracking and reporting handoffs.

Measurement Solutions Pvt Ltd | Graduate Engineer / Operation Analyst

Jan 2023 – Jul 2023

- Cut average vendor lead times 23% (6.5 to 5 weeks) across 8 vendors, measured against baseline procurement cycle time, by diagnosing bottlenecks and driving cross-functional coordination.
- Improved project data accuracy 20%, measured through validation checks, by building validation processes and resolving discrepancies with stakeholders.

Design Engineering Intern | Codebreakers

May 2021 – Jul 2021

- Redesigned a 3-layer swing toolbox under material and usability constraints, reducing material waste by 12% and improving procurement efficiency by 15%.

PROJECTS

Vehicle Defect Risk Prioritization Project

- Surfaced a defect category with 13x higher severity than top-ranked categories under standard frequency ranking, measured across ~10,000 NHTSA complaints spanning 3 manufacturers, by building a severity- and detectability-weighted risk model.
- Prevented a flawed prioritization decision, measured by restoring accurate frequency counts across ~40 defect categories, by catching and correcting a data-parsing defect that had fragmented complaint records into false categories.
- Elevated a defect category representing just 0.2% of complaint volume into the top-priority tier, measured by RPN scoring with SQL NTILE-based normalization, by designing an FMEA-inspired risk model that closes a blind spot standard Pareto analysis can't catch.

Bamboo Nano Hat Liner

- Narrowed to the highest-viability concept, measured by screening 30+ candidate designs against user need, cost, and manufacturability criteria, by leading structured product discovery for a washable cap liner.
- Validated design feasibility and fit, measured through physical form-fit testing, by prototyping in SolidWorks and iterating through 3D-printed revisions.
- Increased projected NPV 22% (\$1.56M to \$1.91M), measured through pricing-sensitivity and margin modeling, by building go-to-market models to test customer willingness to pay.

CERTIFICATIONS

- Google Project Management Professional
- IBM AI Fundamentals

- SQL for Data Analysis (UC Davis)
- Microsoft Power BI (Udemy)
